AUTHOR: Materova, Ye. A.; Skabichevskiy, P. A.

TITLE: Ion exchange properties of zirconyl phosphate. I. Investigation of the dependence of ion exchange properties of zirconyl phosphate on the conditions of its production.

SOURCE: Leningrad. Universitet. Vestnik. Seriya fiziki i khimii, no. 2, 1964, 65-73

TOPIC TAGS: zirconyl phosphate, ion exchange property, production condition, preparation method, titration curve, ion exchange capacity, drying, precipitation condition, component ratio

ABSTRACT: The effects of the precipitation conditions (concentrations, acidity, $ZrO_2:P_2O_5$ ratio, temperature) in the preparation of zirconyl phosphate on its composition and ion exchange properties were studied. From the potentiometric titration curves of zirconyl phosphates which differ in their properties it was shown that the ion exchange capacity of zirconyl phosphate is a function of the sample composition. Samples having a molar ratio of $ZrO_2:P_2O_5$ much greater than 1 have a

Card 1/3

ACCESSION NR: AP4041835

smaller number of functional strongly acid ionogen groups with a reduced ability to dissociate and hence a lower ion exchange capacity. The conditions for obtaining zirconyl phosphate samples having maximum ion exchange capacity, i.e., ZrO_2/P_2O_5 closest to 1, include the use of freshly prepared zirconium salt solutions (0.2-0.5M) containing 4-5M HNO_3 or HCl, and 0.2-1M H_3PO_4 . More concentrated zirconium solution or higher acidity causes formation of a precipitate which is hard to filter. The rate and order of pouring the solutions does not affect the properties of the precipitated zirconyl phosphate. Increasing the temperature of drying the zirconyl phosphate precipitate up to 300C has no effect on the ion exchange properties, but drying at higher temperatures (500-850C) causes irreversible changes (probably formation of -P-O-P- bonds) which sharply reduce the ion exchange capacity of zirconyl phosphate. "In conclusion the authors express their sincere appreciation to AN SSSR associate member B. P. Nikol'sk for valuable advice in the course of the work and in preparing the manuscript for printing." TITLE: Ion exchange properties of zirconyl phosphate

SOURCE: AN SSSR. Institut fizicheskoy khimii. Issledovaniye svoystv ionoobmennikh materialov (Research on the properties of ion-exchange materials). Moscow, Izd-vo Nauka, 1964, 96-103

TOPIC TAGS: zirconyl phosphate, ion exchange capacity, column chromatography, polymethylmethacrylate, polystyrene

ABSTRACT: In a study of the ion exchange behavior of the compound as a function of the mm ZrO₂ ratio in its molecule, the authors prepared 20 varieties of zirconyl phosphate am P₂O₅ of different composition by reacting different molar proportions of ZrO₂ and P₂O₅ (1: 7, 1: 5, 1: 4, 1: 2, 1: 1.5, 1: 1.1, 1.5: 1, 1.75: 1, 2: 1, 3: 1). Compounds with a ratio of 1.07, 1.09, 1.12, 1.16, 1.20, 1.23, 1.27, 1.55, 1.65, 1.89, 2.01 and 2.98 were prepared by adding phosphoric acid at room temperature to zirconium chloroxide, chloride and nitrate, after which the precipitates, left overnight to settle, were washed with water

Card 1/2

L 31997-65

ACCESSION NR: AT5002303

and dried at 120C for 8 hrs. With some exceptions, absorption of Ba^{2+} , Ca^{2+} , Na^+ and Li^+ by the zirconyl phosphates was found to diminish in that order at $\text{PH} < 7$, but the concentration of the cation in the equilibrium solution and the temperature of drying were also found to be factors in the process. The ion exchange capacity of samples dried at 500, 700 and 850C dropped sharply. Heterogeneous membranes were prepared from samples of the zirconyl phosphates with polymethylmethacrylate and polystyrene as the binders and their potential was measured. "In conclusion, the authors thank B. P. Nikol'skiy, corresponding member of the AN SSSR, for valuable advice on the experimental work and on the manuscript." TITLE: Electrochemical properties of zirconyl phosphate, II. Relationship between the electric conductivity of zirconyl phosphate samples and their composition.

SOURCE: Zhurnal fizicheskoy khimii, v. 38, no. 4, 1964, 985-989

TOPIC TAGS: zirconyl phosphate, composition, ZrO_2 P_2O_5 ratio, electrochemical property, ion exchange capacity, electric conductivity, water sorption, zirconyl phosphate H^+ form, zirconyl phosphate Na^+ form, energy of activation, hydrogen ion mobilityABSTRACT: The dependence of the electric conductivity of zirconyl phosphate on the sample composition was investigated. The electric conductivity of the granular ionite was determined by finding the point at which it was equal to the conductance of a solution in equilibrium with the ion exchanger, and measuring the electric conductivity of the zirconyl phosphate-solvent system. Work was done at 25°C, pH = 3, using an HCl solution and silver chloride electrodes; for determinations on the ionite in the Na^+ form the solution con-

Card 1/3

ACCESSION NR: AP4034585

taining 0.1 equivalents/liter of Na^+ was buffered to pH 4.94 with acetic acid and sodium acetate. It was found the electric conductivity of zirconyl phosphate decreased as the amount of phosphorus in the sample decreased (i.e., as the $\text{ZrO}_2/\text{P}_2\text{O}_5$ ratio k increased). As the value of k approached 1, the number of strongly acid ionogen groups increased; increasing the ZrO_2 content decreased the ability of the phosphate groups to dissociate. Water sorption by different samples of zirconyl phosphate was a factor which, in addition to the composition of the sample, determined the electric conductivity. The greater the ability to absorb water the greater the electric conductivity. However, samples with anomalously high conductivity did not have greater exchange capacity, so the dissociation of the phosphate groups was not increased; the electric conductivity was therefore caused by the greater mobility of the hydrogen ions in the samples containing more water. The mobility of the sodium ion in zirconyl phosphate was considerably less than of the hydrogen ions: the conductance of zirconyl phosphate in the Na^+ form ($k = 1.11$) was 0.7×10^{-4} compared to $2.29 \times 10^{-3} \text{ ohm}^{-1} \text{ cm}^{-1}$ for the H^+ form. The energy of activation of the electric conductivity (calculated by the method of P.P. Hamlen, J. Electrochem. Soc.;, 109, 8, 746 (1962)) for

TITLE: The systems $(\text{NH}_4)_2\text{TiF}_6 - (\text{NH}_4)_2\text{NbOF}_5 - \text{H}_2\text{O}$ (2% HF) and $(\text{NH}_4)_2\text{BeF}_4 - (\text{NH}_4)_2\text{SiF}_6 - \text{H}_2\text{O}$ (2% HF) at 25 and 50°C

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 3, 1966, 675-677

TOPIC TAGS: titanium compound, niobium compound, beryllium compound, silicon compound, phase diagram, solubility, fluoride

ABSTRACT: The solubility in the systems $(\text{NH}_4)_2\text{TiF}_6 - (\text{NH}_4)_2\text{NbOF}_5 - \text{H}_2\text{O}$ (2% HF) and $(\text{NH}_4)_2\text{BeF}_4 - (\text{NH}_4)_2\text{SiF}_6 - \text{H}_2\text{O}$ (2% HF) was studied by isothermal dissolution in order to determine whether titanium can be separated from niobium and beryllium from silicon by fractional crystallization. The systems are of simple eutonic type, where no new solid phases or solid solutions are formed (see Fig. 1). In the first system, the $(\text{NH}_4)_2\text{TiF}_6$ content was determined approximately to be less than 1% in the range of saturated solutions of the composition 0-1.1%. Microscopic analysis showed that in this range the bottom phase is $(\text{NH}_4)_2\text{NbOF}_5$. $(\text{NH}_4)_2\text{TiF}_6$ crystallizes over a wide range of solution compositions. The ratio % $(\text{NH}_4)_2\text{TiF}_6 / % (\text{NH}_4)_2\text{NbOF}_5$ in the eutonic solution is 0.048 at 25 and 0.052 at 50°C, which is favorable to separation. In the

TITLE:

Investigating the excitation system of a klystron frequency multiplier

PERIODICAL:

Referativnyy zhurnal. Avtomatika i radioelektronika, no. 9, 1961, 3, abstract 9 K17 (Nauchno-tekhn. inform. byul. Leningr. politekhn. in-t, 1960, 29-32)

TEXT: The possibility of developing excitation systems for klystron multipliers with metal-ceramic triodes or beam triodes is clarified. The system of uninterrupted frequency multiplication is assumed, i.e. without intermediate multipliers. The construction and parameters of the input circuit of klystron multiplier were studied. The input circuit of the klystron is constructed as a co-axial resonator. Constructional sketch is given. Basic considerations in the design of the oscillating system are indicated. The dependence is given of the triode equivalent load resistance for ($Q = 460$)

TITLE: Sensitivity of circuit for direct detection of microwave oscillator amplitude fluctuations

SOURCE: IVUZ. Radiotekhnika, v. 7, no. 1, 1964, 97-98

TOPIC TAGS: microwave oscillator, microwave generator, microwave oscillator frequency fluctuation, semiconductor diode, germanium diode, amplitude fluctuation detector, amplitude fluctuation detector sensitivity, microwave oscillator noise

ABSTRACT: The sensitivity is defined as the minimum power at which beats between the tested oscillator and a slightly detuned auxiliary oscillator are still distinguishable, and is characterized by the ratio $\gamma = P_s/P_{nf}$, where P_s is the high-frequency detector signal power and P_{nf} is the spectral density of the minimal observed fluctuations. The beat pattern displayed on the oscilloscope is stabilized by frequency-modulating the auxiliary oscillator with the oscilloscope

Card 1/4

ACCESSION NR: AP4024492

sweep voltage. Several different silicon and germanium diodes were tested, and special selection of low-noise diodes made a sensitivity up to 132 dB/cps feasible. Tests have shown that there are optimal values of the input power (0.6 -- 1.0 mW) and of the positive diode bias (0.2-0.3 V) for which the sensitivity is highest. The effect of the noise spectrum and the sources of error are briefly discussed. The possible random visual errors in setting the pattern for maximum sensitivity are estimated at ± 1.5 dB. TITLE: Superheterodyne circuit for measuring SHF fluctuations

SOURCE: Radiotekhnika i elektronika, v. 9, no. 3, 1964, 434-438

TOPIC TAGS: superheterodyne, microwave, SHF, microwave fluctuations, SHF fluctuations, superheterodyne SHF fluctuation meter

ABSTRACT: A two-channel correlation superheterodyne circuit is described which is intended to measure the noise of very low-power SHF oscillators where the direct-detection method is inapplicable. The method suggested by V. N. Nikonorov (IVUZ. Radiofizika, 1959, v. 2, no. 6, p. 1915) involves two independent heterodyne oscillators. The oscillator power is divided by a slot bridge and fed into two identical channels, each consisting of a heterodyne, a mixer, a broadband IF amplifier, and an LF amplifier. The channel output voltages are

Card 1/2

ACCESSION NR: AP4024725

combined in-phase or counter-phase and applied to a spectrum analyzer. The noise of the circuit proper is separated from the fluctuations (noise) being measured. The spectral density of minimum detectable fluctuations is about 4×10^{-22} w/cps. It is believed that the circuit will be capable of testing SHF sources as weak as 10^{-7} w having an amplitude-fluctuation level of 144 db/cps. "Finishing the article, the author feels it his duty to thank S. A. Kornilov for his guidance and constant interest in the project and for the principal idea of the circuit." TITLE: Experimental investigation of transfer-constant fluctuations in a crystal mixer

SOURCE: Radiotekhnika i elektronika, v. 9, no. 3, 1964, 546-547

TOPIC TAGS: crystal mixer, crystal diode, crystal mixer fluctuation , flicker effect, crystal diode flicker effect

ABSTRACT: The noise spectrum of DK-I1, DK-I2, DK-S2, DK-S3, and DG-S4 crystal diodes having a high flicker effect was tested within 3-100 kc in a detector-IF-amplifier-spectrum-analyzer circuit. The diodes were excited by a 3-cm reflex-klystron oscillator. Within the above frequency band, the amplitude fluctuation spectral density was found to be about 10^{-15} and independent of the frequency. Next, the fluctuation spectrum of a superheterodyne built with the

Card 1/2

ACCESSION NR: AP4024735

same crystal diodes was investigated. It was found that, within a 3-100-kc band, the fluctuations of the mixers and, consequently, the sensitivity of the super-heterodyne circuit (with a reflex klystron as a heterodyne) were completely determined by the flicker effect. ŠKACH M.

1142. ŠKACH M. * Měření slinné sekrece u nemocných s xerostomií. Measure-

ment of salivary secretion in xerostomia ČSL. STOMATOL.

1956 4 (160-163) Graphs 2

A method of measuring salivary secretions is described. On the basis of values obtained in the investigation of patients with xerostomia and by their comparison with values obtained in healthy subjects, the lower limit for normal salivary secretion is held to be within the range of 8-10 ml. Values below 8 ml. (in 2 x 15 min.) are considered to be pathological.

Abstract: The registration of blood pressure (BP) in the aorta of decerebrated frogs showed that electric stimulation (ES) of the skin lowered BP in 100% of cases, ES of the stomach lowered it in 75% of cases, ES of the muscles by single shocks changed the BP in 21% of cases, and tetanic stimulation did so in 100% of cases. In stimulation of the muscle by a weight, an increase of BP was observed in 92% of cases and a lowering in 8%. Stimulation

Orig Pub : Tr. Molotovsk. med. in-ta, 1957, No 26, 11-16

Abstract : The head of the experimental subject was placed between two poles of an electromagnet, supplied with current from the lighting circuit. Upon closing the circuit, under the influence of the alternating magnetic field, the 60 subjects all gave evidence of the appearance of phosphene (P) in the form of flashings and scintillations; with fixation upon some object the P disappeared, but reappeared in the peripheral field of vision upon movement of the eyes or of the head. P was more pronounced with the eyes

TITLE: Semiconductor devices for high-quality automatic control systems

SOURCE: IVUZ. Energetika, no. 1, 1966, 26-30

TOPIC TAGS: semiconductor device, automatic control equipment, dc amplifier
ABSTRACT: The article describes the design and operation of an amplifier with galvanic interstage coupling and a thyristor control device which satisfy all normal requirements of the electronic portion of accurate and high-quality automatic control systems. The three-stage amplifier, which employs silicon transistors, provides a gain in the voltage (and power) of a basic mismatching signal and in addition algebraically adds the voltages of this signal and that of a correcting feed-back circuit. Among the advantages of this amplifier are: high voltage gain factor, the availability of separate inputs for the basic signal and the corrective feed-back signal, the possibility of fine adjustment for the common voltage gain of the amplifier and of separate adjustment (within wide limits) for basic channel gain, negligible voltage drift, high stability of the amplifier's parameters, and immunity of its
